Chapter 1

Module Index

1.1 Modules

Here is a list of all modules:

Constants	9
Typedefs/Enums	10
GLUI variables	11

Chapter 2

Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Ball	13
Image	14
MyColor	15
MyStruct	15
Particle	16
Theme	17
Thread	18
MyThread	15
Wall	18

Chapter 3

Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Ball	Simple class for defining ball objects	13
Image	Represents a BMP image	14
MyColor	To store the color attribute in RGB format	15
MyStruct	To store three dimensional variables like position, velocity, etc	15
MyThread	Extends the functionality of Class Thread	15
Particle	Snow particles in background	16
Theme	To store features of theme	17
Thread	Class to be inherited by MyThread	18
Wall	Wall object to define boundaries of window/box	18

Chapter 4

File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

inc/ Ball.h	??
inc/ Collision.h	21
inc/ global.h	21
inc/ GUI.h	22
inc/ imageLoad.h	??
inc/ mainw.h	22
inc/ MyDefines.h	23
inc/ MyEnums.h	24
inc/ MyThread.h	??
inc/ Particle.h	??
inc/ subMenu.h	24
inc/ Theme.h	??
inc/ themeReader.h	25
inc/ thr.h	??
inc/ UtilityFunctions.h	26
inc/ Wall.h	??

Chapter 5

Module Documentation

5.1 Constants

Macros

- #define `MAX_NUM_BALLS` 1000
Maximum number of balls possible on screen.
- #define `UPDATE_TIMER` 20
Minimum time before next `update(int)` function is called.
- #define `DEFAULT_WINDOW_HEIGHT` 1056
Initial height of window.
- #define `DEFAULT_WINDOW_WIDTH` 1855
Initial width of window.
- #define `DEFAULT_WINDOW_DEPTH` 600
Initial Depth of box (in 3D view)
- #define `TIME_LAG` 50
Time after which successive balls enter the window.
- #define `NUM_SEGMENTS` 100
Number of segment along and around z-axis of sphere.
- #define `LIMIT_W` 500
Minimum width of window.
- #define `LIMIT_H` 500
Minimum height of window.
- #define `PI` 3.1415926f
Value of `PI`
- #define `CHANGE_FACTOR` 1.2f
Factor by which speed is increased/decreased on a single click on increase/decrease buttons.
- #define `MAX_SPLITS` 7;
Max number of smaller balls on splitting a ball.
- #define `zDistance` 15.0f
Default view distance from the plane of drawing.
- #define `DT` 0.5f
Time for which position of ball is changed in each update call.
- #define `NUM_PARTICLES` 1000
Number of snow particles in the background.

5.1.1 Detailed Description

5.2 Typedefs/Enums

Enumerations

- enum **GameState** { **PLAY**, **PAUSE** }
- enum **Select** { **YES**, **NO** }

Variables

- GameState **gameState**
- Select **border**
- Select **showMenu**
- Select **enable3D**

5.2.1 Detailed Description

5.3 GLUI variables

Variables

- GLUI * **glui**
- int **theme_group_item_id**
- int **theme_group_id**
- int **view_group_item_id**
- int **view_group_id**
- int **inc_id**
- int **dec_id**
- int **play_id**
- int **split_id**
- int **delete_id**
- int **add_id**
- int **window_id**
- GLUI_Rotation * **cube_rotate**
- float **cube_rotation** [16]
- std::string **speed_str**
- GLUI_StaticText * **speed_text**

5.3.1 Detailed Description

Chapter 6

Class Documentation

6.1 Ball Class Reference

Simple class for defining ball objects.

```
#include <Ball.h>
```

Public Member Functions

- [Ball](#) ()
- int [getID](#) ()
Returns the ID.
- void [setID](#) (int)
Sets the ID.
- [ThreeD](#) [getCenter](#) ()
Returns the center.
- void [setCenter](#) (float, float, float)
Sets the center at (x,y,z) co-ordinates.
- [ThreeD](#) [getVelocity](#) ()
Returns velocity.
- void [setVelocity](#) (float vx, float vy, float vz)
Sets velocity vector (vx, vy, vz)
- float [getRadius](#) ()
Returns radius.
- void [setRadius](#) (float r)
Sets radius.
- float [getMass](#) ()
Returns Mass.
- void [setMass](#) (float)
Sets Mass.
- [Color](#) [getColor](#) ()
Returns Color.
- void [setColor](#) (float, float, float)
Set Color.
- void [Draw](#) (int num_segments)
Draws the [Ball](#).
- void [Move](#) (float)
changes the position of ball according to its velocity in a small interval dt

- bool [clickListen](#) (float, float)
checks if the ball has been clicked
- pthread_mutex_t & [getMutex](#) ()
Returns mutex for synchronization.
- float [getSpeed](#) ()
Returns speed of the ball.

6.1.1 Detailed Description

Simple class for defining ball objects.

6.1.2 Constructor & Destructor Documentation

6.1.2.1 Ball::Ball ()

Constructor Creates a [Ball](#) with default values of parameters

The documentation for this class was generated from the following file:

- inc/Ball.h

6.2 Image Class Reference

Represents a BMP image.

```
#include <imageLoad.h>
```

Public Member Functions

- [Image](#) (char *, int, int)
Constructor.
- [~Image](#) ()
Destructor.

Public Attributes

- char * [data](#)
Pixel data of image.
- int [width](#)
width and height of image
- int **height**

6.2.1 Detailed Description

Represents a BMP image.

The documentation for this class was generated from the following file:

- inc/imageLoad.h

6.3 MyColor Struct Reference

To store the color attribute in RGB format.

```
#include <global.h>
```

Public Member Functions

- [MyColor](#) (float x=1.0f, float y=1.0f, float z=1.0f)
Default color : White (1,1,1)

Public Attributes

- float **r**
- float **g**
- float **b**

6.3.1 Detailed Description

To store the color attribute in RGB format.

The documentation for this struct was generated from the following file:

- inc/[global.h](#)

6.4 MyStruct Struct Reference

To store three dimensional variables like position, velocity, etc.

```
#include <global.h>
```

Public Attributes

- float **x**
- float **y**
- float **z**

6.4.1 Detailed Description

To store three dimensional variables like position, velocity, etc.

The documentation for this struct was generated from the following file:

- inc/[global.h](#)

6.5 MyThread Class Reference

Extends the functionality of Class [Thread](#).

```
#include <MyThread.h>
```

Inheritance diagram for MyThread:

Public Member Functions

- [MyThread](#) (queue< [Ball](#) * > *)
Constructor.
- void [setQueue](#) (queue< [Ball](#) * > *)
sets queue
- queue< [Ball](#) * > * [getQueue](#) ()
return queue
- void [setBall](#) ([Ball](#) *)
sets the ball
- [Ball](#) * [getBall](#) ()
return the ball
- void * [run](#) ()
function which runs when [start\(\)](#) method of parent thread is called

6.5.1 Detailed Description

Extends the functionality of Class [Thread](#).

Extends [Thread](#) Class publicly

The documentation for this class was generated from the following file:

- inc/MyThread.h

6.6 Particle Class Reference

snow particles in background.

```
#include <Particle.h>
```

Public Member Functions

- [Particle](#) ()
Constructor.
- float [getRadius](#) ()
returns radius
- void [setRadius](#) (float r)
sets the radius
- [ThreeD](#) [getCenter](#) ()
returns center
- void [setCenter](#) (float, float, float)
sets center
- [ThreeD](#) [getVelocity](#) ()
returns velocity

- void [setVelocity](#) (float, float, float)
sets velocity
- void [drawP](#) ()
drawing utility function
- void [moveP](#) ()
changes the position of snow particle
- void [reset](#) ()
resets the position of snow particle

6.6.1 Detailed Description

snow particles in background.

The documentation for this class was generated from the following file:

- inc/Particle.h

6.7 Theme Class Reference

To store features of theme.

```
#include <Theme.h>
```

Public Member Functions

- [Theme](#) ()
Theme with default settings.

Public Attributes

- [Color background](#)
Background color.
- [Color clr](#) [3]
Lighting color.
- [ThreeD pos](#) [3]
Lights position.
- bool [isLight](#) [4]
Enable/Disable Light.
- string [image](#)
Background [Image](#).

6.7.1 Detailed Description

To store features of theme.

Changes in this and [should be in sync](#)

The documentation for this class was generated from the following file:

- inc/Theme.h

6.8 Thread Class Reference

Class to be inherited by [MyThread](#).

```
#include <thr.h>
```

Inheritance diagram for Thread:

Public Member Functions

- [Thread](#) ()
Constructor.
- [~Thread](#) ()
Destructor.
- int [start](#) ()
creates a thread and calls run() method
- int [join](#) ()
joins the thread
- int [detach](#) ()
detaches the thread
- pthread_t [self](#) ()
return thread Id
- virtual void * [run](#) ()=0

6.8.1 Detailed Description

Class to be inherited by [MyThread](#).

The documentation for this class was generated from the following file:

- inc/thr.h

6.9 Wall Class Reference

[Wall](#) object to define boundaries of window/box.

```
#include <Wall.h>
```

Public Member Functions

- [Wall](#) ()
Constructor.
- [Wall](#) (PlaneType, float)
Creates wall with at given positon of given type.
- PlaneType [getPlane](#) () const
Returns type of the plane.

- float [getPosition](#) () const
Returns the position of the plane.
- void [setPosition](#) (float)
Sets the position of the plane.

6.9.1 Detailed Description

[Wall](#) object to define boundaries of window/box.

The documentation for this class was generated from the following file:

- inc/Wall.h

Chapter 7

File Documentation

7.1 inc/Collision.h File Reference

```
#include "Wall.h"
#include "Ball.h"
```

Functions

- void [check_Collision_With_Wall](#) ([Ball](#) &, [Wall](#) &)
Checks for a possible collision of a ball with a wall and accordingly update the velocity.
- void [check_Collision_With_Ball](#) ([Ball](#) &, [Ball](#) &)
Checks for a possible collision of two balls with each other and accordingly update the velocities of both the balls using their respective mutexes.

7.1.1 Detailed Description

Functions for maintaining the physics of the system.

All the collisions are elastic.

7.2 inc/global.h File Reference

Classes

- struct [MyStruct](#)
To store three dimensional variables like position, velocity, etc.
- struct [MyColor](#)
To store the color attribute in RGB format.

Typedefs

- typedef struct [MyStruct](#) [ThreeD](#)
To store three dimensional variables like position, velocity, etc.
- typedef struct [MyColor](#) [Color](#)
To store the color attribute in RGB format.

7.2.1 Detailed Description

Useful Structures are defined here.

7.3 inc/GUI.h File Reference

```
#include <GL/glut.h>
#include <GL/glui.h>
#include "imageLoad.h"
```

Functions

- void [handleMouse](#) (int, int, int, int)
glutMouseFunc
- void [handleResize](#) (int, int)
glutReshapeFunc
- void [handleKeyPress](#) (unsigned char, int, int)
glutKeyboardFunc
- GLuint [loadTexture](#) ([Image](#) *)
loads texture from an [Image](#)
- void [drawBox](#) ()
draws a 3D box at boundaries of balls i.e. walls
- void [drawScene](#) ()
glutDrawFunc
- void [initRendering](#) ()
initialize the graphics rendering
- void [update](#) (int)
glutTimerFunc

7.3.1 Detailed Description

OpenGL functions are maintained in this separate file.

Any changes regarding graphics rendering should be made here.

7.4 inc/mainw.h File Reference

```
#include <GL/glut.h>
#include <GL/glui.h>
#include <queue>
#include <vector>
#include <utility>
#include "Ball.h"
#include "MyThread.h"
#include "Wall.h"
#include "Theme.h"
#include "imageLoad.h"
#include "Particle.h"
```

Variables

- float **ALPHA**
- float **rotate**
- int **number_of_balls**
- vector< [MyThread](#) * > **threads**
- float **wideAngle**
- float **ratio**
- int **window_height**
- int **window_width**
- float **angleX**
- float **angleY**
- float **angleZ**
- int **borderNumber**
- float **viewDistance**
- GLuint **t1**
- GLuint **tex3d**
- GLuint **wall_tex**
- GLUquadric * **quad**
- GLuint **_textureId**
- vector< [Theme](#) * > **themes**
- [Theme](#) * **curTheme**
- [Wall](#) **wall_x**
- [Wall](#) **wall_y**
- [Wall](#) **wall_z**
- [Particle](#) * **particles**

7.4.1 Detailed Description

File containing global variables to be used in other files/classes

7.5 inc/MyDefines.h File Reference

Macros

- #define [MAX_NUM_BALLS](#) 1000
Maximum number of balls possible on screen.
- #define [UPDATE_TIMER](#) 20
Minimum time before next [update\(int\)](#) function is called.
- #define [DEFAULT_WINDOW_HEIGHT](#) 1056
Initial height of window.
- #define [DEFAULT_WINDOW_WIDTH](#) 1855
Initial width of window.
- #define [DEFAULT_WINDOW_DEPTH](#) 600
Initial Depth of box (in 3D view)
- #define [TIME_LAG](#) 50
Time after which successive balls enter the window.
- #define [NUM_SEGMENTS](#) 100
Number of segment along and around z-axis of sphere.
- #define [LIMIT_W](#) 500
Minimum width of window.
- #define [LIMIT_H](#) 500

- *Minimum height of window.*
- `#define PI 3.1415926f`
Value of `PI`
- `#define CHANGE_FACTOR 1.2f`
Factor by which speed is increased/decreased on a single click on increase/decrease buttons.
- `#define MAX_SPLITS 7;`
Max number of smaller balls on splitting a ball.
- `#define zDistance 15.0f`
Default view distance from the plane of drawing.
- `#define DT 0.5f`
Time for which position of ball is changed in each update call.
- `#define NUM_PARTICLES 1000`
Number of snow particles in the background.

7.5.1 Detailed Description

All the constants are defined here in seperate file.

7.6 inc/MyEnums.h File Reference

Enumerations

- enum **GameState** { **PLAY**, **PAUSE** }
- enum **Select** { **YES**, **NO** }

Variables

- GameState **gameState**
- Select **border**
- Select **showMenu**
- Select **enable3D**

7.6.1 Detailed Description

Enums are defined in this seperate file.

7.7 inc/subMenu.h File Reference

```
#include <GL/glut.h>
#include <GL/glui.h>
#include <string.h>
```

Functions

- void **myGlutIdle** (void)
glutIdleFunc
- void **glui_callback** (int)
Common call back function for all the menu buttons.

- void `initMenu` ()
Initializes the menu. Adds panels, buttons and other items.

Variables

- `GLUI *` `glui`
- int `theme_group_item_id`
- int `theme_group_id`
- int `view_group_item_id`
- int `view_group_id`
- int `inc_id`
- int `dec_id`
- int `play_id`
- int `split_id`
- int `delete_id`
- int `add_id`
- int `window_id`
- `GLUI_Rotation *` `cube_rotate`
- float `cube_rotation` [16]
- `std::string` `speed_str`
- `GLUI_StaticText *` `speed_text`

7.7.1 Detailed Description

Interface using GL user interface library, `glui.h`

All the changes to the menu should be added in this file only.

7.8 inc/themeReader.h File Reference

```
#include <vector>
#include <fstream>
#include <iostream>
#include "Theme.h"
```

Functions

- `vector< Theme * >` `readThemes` (const char *filename)
Loads different theme from themeFile.txt into a vector .
- bool `readBool` (ifstream &fin)
utility to read a bool from file
- float `readFloat` (ifstream &fin)
utility to read a float from file

7.8.1 Detailed Description

Changes in this and class `should be in sync`

7.9 inc/UtilityFunctions.h File Reference

```
#include "Ball.h"  
#include "Theme.h"
```

Functions

- void **preProcessTheme** ()
- void **setTheme** ([Theme](#) &)
- pair< float, float > **convPixel** (int, int)
- void **changeVelocity** ([Ball](#) &, float)
- int **findClickedBall** (float, float)
- [Ball](#) * **createNewBall** ()
- void **splitBall** ([Ball](#) &, int)
- void **addBall** ()
- void **deleteBall** (int)
- void **setSpeedText** ([Ball](#) &)
- void **resetSpeedText** ()
- void **addNewThread** ()
- void **addWorkItems** ()
- float **getRandomFloat** ()

7.9.1 Detailed Description

Functions required from main function and other classes. To add extra features/functionality define in this file only.
